

NetPriva Appliance Gateway™

Head and large office network performance solution

NetPriva Appliance Gateway is proven traffic shaping software that runs on a variety of hardware platforms to provide on demand bandwidth guarantees to your key business applications on your wide area network.

Appliance Gateway provides instant network visibility and control through flexible rules based policies for controlled quality of service (QoS).

Appliance Gateway guarantees bandwidth and controls latency, in particular jitter for real time applications such as voice and key business applications and users such as illustrated in the table.

Application / User	WAN link %	Jitter Max. ms	Manager	Sales	Admin
ERP / Citrix	40%	-	Reports	Orders	Reports
Outlook	10%	-		Y	
Salesforce.com	10%	-	Y	Y	N
Voice	30%	100		Y	
File transfer	5%	-	Y	N	Y
Other	5%	-	Y	N	Y

The effect of the NetPriva policy for an application is to provide the specified guaranteed minimum bandwidth to the application covered by the policy. It can be specified as a % of the WAN link bandwidth or as an absolute bandwidth in Kbps or Mbps.

The policy comes into operation whenever there is congestion on the link. The policy guarantees do not restrict the bandwidth of other applications on the link if there is no important application traffic, or no congestion on the link.

Appliance Gateway provides highly granular (*per-second*) real time network visibility and monitoring and proactive management and control of your branch office wide area network (WAN) applications.

It also has the ability to replay *per-second* network scenarios from days or weeks ago, with instant drill down into the root causes of application performance issues.

Ease of use is a key part of NetPriva's solution approach. The Appliance Gateway can provide you with network visibility for troubleshooting and policy based control within just minutes upon installation.

Business benefits include: users of important business applications in branch offices are more productive and customer service improves. Helpdesk and support costs are reduced. Infrastructure investments such as MPLS are extended and protected.

Appliance Gateway makes bandwidth management practical and economical for head and large branch offices. When complemented with NetPriva Virtual Gateway for branch offices it provides a complete enterprise solution.

Key features and benefits of NetPriva Appliance Gateway:

- Application visibility supports drill down into network performance issues, audit usage, and fact based capacity planning
- Visibility extends to URL for web based applications
- For Citrix visibility extends to traffic within the Citrix ICA channel
- Per second real time and historical visibility allows identification of root cause of network congestion
- QoS policies by application and user *proactively* protect and guarantee bandwidth and control jitter to your important business applications and users
- Intuitive Console for easy system management and reduced training and support costs
- Runs on selected low cost 1RU and set top box servers
