

NetPriva Virtual Gateway™

Branch office network performance solution

NetPriva Virtual Gateway is the world's first software-only distributed traffic shaper that provides application delivery with guaranteed bandwidth.

This delivers consistent application response right to the desktop of branch office users of business critical applications without the need to install or configure a physical appliance.

Virtual Gateway provides policy-based network control to **guarantee bandwidth and control latency**, in particular jitter for real time applications such as voice and key business applications and users such as illustrated in the table.

Application / User	WAN link %	Jitter Max. ms	Manager	Sales	Admin
ERP / Citrix	40%	-	Reports	Orders	Reports
Outlook	10%	-	Y		
Salesforce.com	10%	-	Y	Y	N
Voice	30%	100	Y		
File transfer	5%	-	Y	N	Y
Other	5%	-	Y	N	Y

The effect of the NetPriva policy for an application is to provide the specified guaranteed minimum bandwidth to the application covered by the policy. It can be specified as a % of the WAN link bandwidth or as an absolute bandwidth in Kbps or Mbps.

The policy comes into operation whenever there is congestion on the link.

The policy guarantees do not restrict the bandwidth of other applications on the link if there is no important application traffic, or no congestion on the link.

Virtual Gateway also provides **highly granular real time network visibility and monitoring**.

It also has the ability to **replay per-second network scenarios** from days or weeks ago, with instant drill down into the root causes of application performance issues.

Virtual Gateway works even in **secure (encrypted) traffic environments**.

Business benefits include: users of important business applications in branch offices are more productive and customer service improves. Helpdesk and support costs are reduced. Infrastructure investments such as MPLS are extended and protected.

NetPriva makes branch office bandwidth management **economical** for even the smallest branch office. When complemented with NetPriva Appliance Gateway for head and large offices it provides a **complete enterprise solution**.

Key features and benefits of NetPriva Virtual Gateway:

- Application and User visibility supports drill down into network performance issues, audit usage, and fact based capacity planning
- Per second real time and historical visibility allows identification of root cause of network congestion
- QoS policies by application and user *proactively* protect and guarantee bandwidth and minimize jitter for your important business applications and users
- Works in secure (encrypted) environments
- Intuitive Console for easy system management and reduced training and support costs
- No appliance costs

NetPriva Virtual Gateway runs on Windows XP/2000 and Windows server 2003 platforms.
